The compounds of the formula 1 according to the invention can be synthesized from the corresponding starting compounds, for example according to the reaction scheme 1 given below. The synthesis is carried out in a manner known to the expert, for example as described in more detail in the examples which follow the schemes.

Scheme 1:

Compounds of the formula 2 can be transformed directly to compounds of the formula 1, for example by electrophilic aromatic substitution. Examples to be mentioned are aminoalkylation or halogenation reactions for the synthesis of compounds of the formula 1 with, for example, R2 = mono- or di-1-4C-alkylaminomethyl or halogen.

Alternatively, compounds of the formula 2 can be first transformed, for example by a Vilsmeier formylation, to compounds of the formula 3, followed by further derivatization reactions, which are known to the expert (for example reduction of the carbonyl group, followed if desired by an etherification, or oxidation of the formyl functionality to a carboxylic acid, followed if desired by reaction with a suitable

amine and formation of an amide group $R_2 = -CO-NR_{21}R_{22}$, or addition of Grignard reagents, followed if desired by an oxidation of the secondary hydroxy group), which lead to compounds of the formula 1.

Another possible access to compounds of the formula 1 is, for example, offered by the transformation of compounds of the formula 4a, for example by C-C-bond forming reactions, like for example Heck-, Suzuki- or Sonogashira-coupling reactions, followed, if desired, by further derivatization reactions known to the expert, like for example reduction of unsaturated substituents R_2 to the corresponding 1-4C-alkyl chains. Compounds of the formula 4a can be prepared from compounds of the formula 2 for example by a halogenation reaction, for example a bromination reaction using a bromination reagent, like for example N-bromosuccinimide.

Compounds of the formula 1 can also be obtained by treatment of compounds of the formula 4b with an alkylation agent, e. g. methyl iodide, and subsequent nucleophilic substitution of the quaternary ammonium group, e. g. vs. cyanide. Compounds of the formula 4b can be prepared for example from compounds of the formula 2 by electrophilic substitution with Eschenmoser's salt.

Still another access to compounds of the formula 1 is, for example, offered by the transformation of compounds of the formula 2 to compounds of the formula 1 with $R_2 = NH_2$. This transformation can be achieved for example in analogy to the reactions described in J. Med. Chem., 1989, 32, 1686 or by nitration of compounds of the formula 2 and subsequent reduction of the nitro group. Further transformations by reactions known to the expert can then lead, if desired, to compounds of the formula 1 with $R_2 =$ mono- or di-1-4C-alkylamino, 1-4C-alkylcarbonylamino, 1-4C-alkoxycarbonylamino or 1-4C-alkoxy-1-4C-alkoxycarbonylamino. Alternatively, compounds of the formula 1 with $R_2 = NH_2$ can be transformed into the corresponding diazonium salts. Further compounds of the formula 1, for example where R_2 is e. g. hydroxy or 1-4-C-alkoxy, can then be obtained by substitution of the diazonium group via reactions known to the expert.

Compounds of the formula 2 can be prepared, for example according to the reaction sequence outlined in scheme 2.

Scheme 2

Compounds of the formula 7 can be obtained for example from compounds of the formula 5 by an O-alkylation followed by a thermally induced Claisen-rearrangement reaction of the O-alkylation product of the formula 6. Protection of the alcohol functionality in compounds of the formula 7 with a suitable protection group Prot, for example a pivaloyl group, using standard conditions leads to compounds of the formula 8, which can be subjected in a next reaction step for example to a cross metathesis reaction, for example using a suitable Grubbs catalyst, suitable for the introduction of the Arom residue. The reaction products of the formula 9 can be deprotected and the ring closure can be performed using methods known to the expert, for example under acidic conditions, which leads to the desired compounds of the formula 2.

Compounds of the formula 5 can be prepared as outlined in an exemplary manner in scheme 3.

Scheme 3

The preparation of compounds of the formula 11 from compounds of the formula 10 is carried out in a manner known per se to the person skilled in the art, for example in analogy to the reactions described in an exemplary manner in the International Patent Application WO 03/014123. Hydrogenation of compounds of the formula 11 to compounds of the formula 5 is carried out in a manner known per se to the person skilled in the art, using standard reaction conditions, like for example hydrogen / Pd(0).

The derivatization, if any, of the compounds obtained according to the above Schemes 1, 2 and 3 (e.g. conversion of a group R_3 into another group R_3 or conversion of a group R_2 into another group R_2) is likewise carried out in a manner known to the expert. If, for example, compounds where $\text{R}_3 = -\text{CO}-1-4\text{C-alkoxy}$ or $\text{R}_3 = -\text{CO}-\text{NR}_3\text{R}_3\text{R}_3\text{R}_3$ are desired, an appropriate derivatization can be performed in a manner known to the expert (e. g. metal catalysed carbonylation of the corresponding halo compound or conversion of an ester into an amide) at the stage of the compounds of formula 2 or 5 (schemes 2 and 3) or more conveniently at a later point in time.

The examples below serve to illustrate the invention in more detail without limiting it. Further compounds of the formula 1 whose preparation is not described explicitly can likewise be prepared in an analogous manner or in a manner known per se to the person skilled in the art, using customary process techniques. The abbreviation min stands for minute(s), h stands for hour(s), and m.p. stands for melting point.

I. 2-Methyl-9-phenyl-7H-8,9-dihydro-pyrano[2,3-c]imidazo[1,2-a]pyridine-6-carboxylic acid dimethylamide

The product of the cross-metathesis reaction (6.6 g), containing pivaloic acid 6-dimethylcarbamoyl-2-methyl-7-(3-phenyl-allyl)-imidazo[1,2-a]pyridine-8-yl ester (6.05 g, 14.4 mmol) and pivaloic acid 7-allyl-6-dimethylcarbamoyl-2-methyl-imidazo[1,2-a]pyridine-8-yl ester (0.55 g, 1.6 mmol) was treated with

200 ml of *ortho*-phosphoric acid (85 %). The resulting green solution was heated for 50 minutes to 80 °C. The reaction mixture was cooled to room temperature, diluted with dichloromethane (200 ml), and neutralized with a 6 N solution of sodium hydroxide at 0 °C. The phases were separated and the aqueous phase was extracted with dichloromethane (2 x 200 ml). The combined organic phases were dried over sodium sulfate and concentrated under reduced pressure. The crude product was purified by flash chromatography [210 g of silica gel, solvent: ethyl acetate / methanol = 9:1 (v/v)]. A colourless solid (4.4 g, 91 % yield, melting point: 189 °C) was obtained, which was the pure title compound as indicated by ¹H-NMR analysis. – ¹H-NMR (CDCl₃, 200 MHz): δ = 2.26 (m_c, 2 H), 2.41 (s, 3 H), 2.58, 2.77 (2 m_c, 2 H), 2.94 (s, 3 H), 3.12 (s, 3 H), 5.31 (dd, 1 H), 7.40 (m_c, 6 H), 7.67 (s, 1 H).

J. 2-Methyl-9-phenyl-7H-8,9-dihydro-pyrano[2,3-c]imidazo[1,2-a]pyridine-6-carboxylic acid dimethylamide prepared by one-pot synthesis

The title compound can also be obtained by application of a one-pot procedure: In a flame-dried flask filled with argon, pivaloic acid 6-dimethylcarbamoyl-7-allyl-2-methyl-imidazo[1,2-a]pyridine-8-yl ester (4.80 g, 14.0 mmol) was dissolved in dichloromethane (100 ml) which had been degassed with argon. After addition of *trans*-stilbene (10.10 g, 56.0 mmol) and second-generation Grubbs catalyst (CAS 246047-72-3, 475 mg, 0.56 mmol, 4 mol-%) the solution was heated to 40 °C. The reaction mixture was stirred for 18 hours at this temperature and was then concentrated under reduced pressure. A green solid was obtained which was treated with 100 ml of *ortho*-phosphoric acid (85 %). The suspension was heated to 80 °C. After a period of 1 h, a clear solution was obtained which was cooled to room temperature and poured onto a mixture of ice water (50 ml) and dichloromethane (50 ml). A pH of 8 was adjusted by addition of 6 N sodium hydroxide solution. The phases were separated and the aqueous phase was extracted with dichloromethane (2 x 20 ml). The combined organic phases were dried over sodium sulfate and concentrated under reduced pressure. The residue, 16 g of a green solid, was purified by flash chromatography [320 g of silica gel, solvent: petrol ether (to remove excess *trans*-stilbene), then ethyl acetate / methanol = 100:2 (v/v)]. The title compound (3.0 g, 64 %) was isolated as a green foamy solid, pure by means of ¹H-NMR spectroscopy. – ¹H-NMR (CDCl₃, 200 MHz): δ = 2.26 (m_c, 2 H), 2.41 (s, 3 H), 2.58, 2.77 (2 m_c, 2 H), 2.94 (s, 3 H), 3.12 (s, 3 H), 5.31 (dd, 1 H), 7.40 (m_c, 6 H), 7.67 (s, 1 H).

A flask containing dry DMF (12 ml) was cooled to 0 °C and phosphorus oxychloride (0.914 g, 5.96 mmol) was added. The cooling bath was removed and the solution was stirred for 1 h at room temperature. The red reaction mixture was treated with a solution of 2-methyl-9-phenyl-7H-8,9-dihydro-pyrano[2,3-c]imidazo[1,2-a]pyridine-6-carboxylic acid dimethylamide (0.800 g, 2.39 mmol) in dry DMF

(12 ml) and was heated to 60 °C. After a period of 5 hours, the reaction mixture was poured on ice water (10 ml), neutralized by addition of 6 N sodium hydroxide solution, and was then extracted with dichloromethane (3 x 20 ml). The combined organic phases were dried over sodium sulfate and concentrated *in vacuo*. The title compound (0.700 g, 81 %) was obtained as a yellow solid, pure by means of ¹H-NMR spectroscopy. – ¹H-NMR (CDCl₃, 200 MHz): δ = 2.31 (m_c, 2 H), 2.72 (s, m_c, 4 H), 2.89, 2.95 (m_c, s, 4 H), 3.15 (s, 3 H), 5.34 (dd, 1 H), 7.39 (m_c, 5 H), 9.09 (s, 1 H), 9.99 (s, 1 H).

Commercial utility

The compounds of the formula 1 and their salts have valuable pharmacological properties which make them commercially utilizable. In particular, they exhibit marked inhibition of gastric acid secretion and an excellent gastric and intestinal protective action in warm-blooded animals, in particular humans. In this connection, the compounds according to the invention are distinguished by a high selectivity of action, an advantageous duration of action, a particularly good enteral activity, the absence of significant side effects and a large therapeutic range.

"Gastric and intestinal protection" in this connection is understood as meaning the prevention and treatment of gastrointestinal diseases, in particular of gastrointestinal inflammatory diseases and lesions (such as, for example, gastric ulcer, peptic ulcer, including peptic ulcer bleeding, duodenal ulcer, gastritis, hyperacidic or medicament-related functional dyspepsia), which can be caused, for example, by microorganisms (e.g. *Helicobacter pylori*), bacterial toxins, medicaments (e.g. certain antiinflammatories and antirheumatics, such as NSAIDs and COX-inhibitors), chemicals (e.g. ethanol), gastric acid or stress situations. "Gastric and intestinal protection" is understood to include, according to general knowledge, gastroesophageal reflux disease (GERD), the symptoms of which include, but are not limited to, heartburn and/or acid regurgitation.

In their excellent properties, the compounds according to the invention surprisingly prove to be clearly superior to the compounds known from the prior art in various models in which the antiulcerogenic and the antisecretory properties are determined. On account of these properties, the compounds of the formula 1 and their pharmacologically acceptable salts are outstandingly suitable for use in human and veterinary medicine, where they are used, in particular, for the treatment and/or prophylaxis of disorders of the stomach and/or intestine

A further subject of the invention are therefore the compounds according to the invention for use in the treatment and/or prophylaxis of the abovementioned diseases.

The invention likewise includes the use of the compounds according to the invention for the production of medicaments which are employed for the treatment and/or prophylaxis of the abovementioned diseases.

The invention furthermore includes the use of the compounds according to the invention for the treatment and/or prophylaxis of the abovementioned diseases.

A further subject of the invention are medicaments which comprise one or more compounds of the formula 1 and/or their pharmacologically acceptable salts.

The medicaments are prepared by processes which are known per se and familiar to the person skilled in the art. As medicaments, the pharmacologically active compounds according to the invention (= active compounds) are either employed as such, or preferably in combination with suitable pharmaceutical auxiliaries or excipients in the form of tablets, coated tablets, capsules, suppositories, patches (e.g. as TTS), emulsions, suspensions or solutions, the active compound content advantageously being between 0.1 and 95% and it being possible to obtain a pharmaceutical administration form exactly adapted to the active compound and/or to the desired onset and/or duration of action (e.g. a sustained-release form or an enteric form) by means of the appropriate selection of the auxiliaries and excipients.

The auxiliaries and excipients which are suitable for the desired pharmaceutical formulations are known to the person skilled in the art on the basis of his/her expert knowledge. In addition to solvents, gel-forming agents, suppository bases, tablet auxiliaries and other active compound excipients, it is possible to use, for example, antioxidants, dispersants, emulsifiers, antifoams, flavor corrigents, preservatives, solubilizers, colorants or, in particular, permeation promoters and complexing agents (e.g. cyclodextrins).

The active compounds can be administered orally, parenterally or percutaneously.

In general, it has proven advantageous in human medicine to administer the active compound(s) in the case of oral administration in a daily dose of approximately 0.01 to approximately 20, preferably 0.05 to 5, in particular 0.1 to 1.5, mg/kg of body weight, if appropriate in the form of several, preferably 1 to 4, individual doses to achieve the desired result. In the case of a parenteral treatment, similar or (in particular in the case of the intravenous administration of the active compounds), as a rule, lower doses can be used. The establishment of the optimal dose and manner of administration of the active compounds necessary in each case can easily be carried out by any person skilled in the art on the basis of his/her expert knowledge.

If the compounds according to the invention and/or their salts are to be used for the treatment of the abovementioned diseases, the pharmaceutical preparations can also contain one or more pharmacologically active constituents of other groups of medicaments, for example: tranquilizers (for example from the group of the benzodiazepines, for example diazepam), spasmolytics (for example, bietamiverine or camylofine), anticholinergics (for example, oxyphencyclimine or phencarbamide), local anesthetics, (for example, tetracaine or procaine), and, if appropriate, also enzymes, vitamins or amino acids.

To be emphasized in this connection is in particular the combination of the compounds according to the invention with pharmaceuticals which inhibit acid secretion, such as, for example, H_2 blockers (e.g. cimetidine, ranitidine), H^+/K^+ ATPase inhibitors (e.g. omeprazole, pantoprazole), or further with so-called peripheral anticholinergics (e.g. pirenzepine, telenzepine) and with gastrin antagonists with the aim of increasing the principal action in an additive or super-additive sense and/or of eliminating or of decreasing the side effects, or further the combination with antibacterially active substances (such as,

for example, cephalosporins, tetracyclines, penicillins, macrolides, nitroimidazoles or alternatively bismuth salts) for the control of *Helicobacter pylori*. Suitable antibacterial co-components which may be mentioned are, for example, mezlocillin, ampicillin, amoxicillin, cefalothin, cefoxitin, cefotaxime, imipenem, gentamycin, amikacin, erythromycin, ciprofloxacin, metronidazole, clarithromycin, azithromycin and combinations thereof (for example clarithromycin + metronidazole).

In view of their excellent gastric and intestinal protection action, the compounds of formula 1 are suited for a free or fixed combination with those medicaments (e.g. certain antiinflammatories and antirheumatics, such as NSAIDs), which are known to have a certain ulcerogenic potency. In addition, the compounds of formula 1 are suited for a free or fixed combination with motility-modifying drugs.

Pharmacology

The excellent gastric protective action and the gastric acid secretion-inhibiting action of the compounds according to the invention can be demonstrated in investigations on animal experimental models. The compounds of the formula 1 according to the invention investigated in the model mentioned below have been provided with numbers which correspond to the numbers of these compounds in the examples.

Testing of the secretion-inhibiting action on the perfused rat stomach

Methodology

The abdomen of anesthetized rats (CD rat, female, 200-250 g; 1.5 g/kg i.m. urethane) was opened after tracheotomy by a median upper abdominal incision and a PVC catheter was fixed transorally in the esophagus and another via the pylorus such that the ends of the tubes just projected into the gastric lumen. The catheter leading from the pylorus led outward into the right abdominal wall through a side opening.

After thorough rinsing (about 50-100 ml), warm (37°C) physiological NaCl solution was continuously passed through the stomach (0.5 ml/min, pH 6.8-6.9; Braun-Unita I). The pH (pH meter 632, glass electrode EA 147; $\phi = 5$ mm, Metrohm) and, by titration with a freshly prepared 0.01N NaOH solution to pH 7 (Dosimat 665 Metrohm), the secreted HCl were determined in the effluent in each case collected at an interval of 15 minutes.

The gastric secretion was stimulated by continuous infusion of 1 $\mu\text{g/kg}$ (= 1.65 ml/h) of i.v. pentagastrin (left femoral vein) about 30 min after the end of the operation (i.e. after determination of 2 preliminary fractions). The substances to be tested were administered intraduodenally in a 2.5 ml/kg liquid volume 60 min after the start of the continuous pentagastrin infusion. The body temperature of the animals

was kept at a constant 37.8-38°C by infrared irradiation and heat pads (automatic, stepless control by means of a rectal temperature sensor).
